MATERNAL CRITICAL CARE

COURSE DESCRIPTION

As a medical community, we were acutely faced with the implications of critical illness on maternal outcomes, pregnancy progression and fetal wellbeing when the COVID-19 pandemic taxed our knowledge, systems, and readiness to care for this complex specialty population. In this two-day course, we will provide the learner with a comprehensive review of maternal critical illness. Developed by a multidisciplinary team of experts in the fields of Obstetrics, Maternal Fetal Medicine, Obstetric Anesthesiology, Internal Medicine and Critical Care Medicine, this conference will promote a team-based approach on maternal critical care topics using evidenced-based learning techniques incorporating adult learning theory.

The main sessions will present an overview of maternal morbidity and mortality, common and unique obstetric emergencies, and how to build bridges between labor and delivery and the critical care units. Participants will have the opportunity to demonstrate clinical application during case-based teamwork activities and glean practical tips from expert petitioners. This course is designed for physicians, physician assistants, advanced practice nurses, ICU nurses, Labor and Delivery nurses, pharmacists, and all other healthcare providers with an interest in maternal critical care.
